

Nitrosamine compounds for Metformin

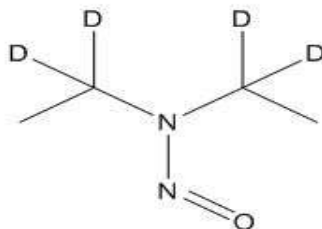

Metformin is often given as the first line of treatment for patients with Type II diabetes

The U.S. Food and Drug Administration (USFDA) has said the agency laboratory tests has revealed levels of nitrosamine impurity N-Nitrosodimethylamine (NDMA) above acceptable intake limit in several lots of the extended-release (ER) formulation of metformin.

NDMA are a concern because of the possible cancer risk to people if they were exposed to it at above-acceptable levels and over long periods of time. Nitrosamine compounds and its related impurities are now available with Clearsynth.
